Mission Accomplished — Google Ads Deep Analysis

Prepared: 2026-07-02 · **Analyst:** Edu (Head of Paid Ads, TSD) **Account:** Mission Accomplished — Customer ID `8634274092` (MCC Topservdigital `4155514468`) **Scope:** PPC only. Read-only — **no changes were made to the account.** LSA account (`4904262993`) excluded per client focus. **Data window:** Last 30 days unless noted. Pulled live via `google-ads-ratos` scripts.

---

1. Executive summary

Mission Accomplished is a **call-driven HVAC business** in the Mohave County tri-state area (Lake Havasu City, Fort Mohave, Mohave Valley, Parker AZ · Needles CA). The account runs on essentially **one engine**: a single Performance Max campaign that carries ~91% of spend. It is performing well right now — but that performance is riding **peak desert-summer AC demand**, a **single unstructured asset group**, and a **conversion-tracking setup that is messy on paper**, even if the live bidding signal is cleaner than it first looks.

KPI (last 30d)	Value
Spend	**$5,376**
Conversions (counted)	**94**
CPA	**$57**
Clicks	3,195 · CTR 2.33% · avg CPC $1.68
Search impression share	46.5%

Bottom line: the account is healthy on the surface but **fragile** — one campaign, one asset group, one season, and a conversion config that needs cleanup before we scale budget. The upside (structure + non-branded expansion) is real and largely untapped.

---

2. Where the money goes

Campaign	Type	Status	Spend	Conv	CPA	Search IS
TSD_04.07_PMAX_Evergreen_HVAC	PMax	ENABLED	$4,884 (90.8%)	88	**$55.50**	46.0%
TSD_04.08_Search_Branded_Evergreen_Mix	Search (branded)	ENABLED	$491	6	$81.90	98.3%
~70 legacy "Levergy \	… \	City" + stale TSD builds	Search/Display/PMax	PAUSED	—	—	—	—

Only **two campaigns are live**. Everything else is paused clutter. The whole account effectively *is* the PMax campaign.

---

3. Trajectory — the season is doing a lot of the work

Account-level, calendar months (both live campaigns):

Month	Conv	Spend	CPA
April	33	$3,450	**$104**
May	37	$4,344	**$117**

Month	Conv	Spend	CPA
June	100	$5,591	**$56**

CPA **halved** from May to June while conversions nearly tripled. That is not a single optimization win — it is **PMax maturing + peak AC season** in a 110°F+ desert market. PMax lifetime is **388 conversions / $18,325 spend**.

> ⚠️ **Plan for regression.** As summer heat fades (Sept onward), demand and CPA will normalize back toward the $80–110 range. Do **not** panic-cut budget when that happens, and start shifting messaging to **heating/furnace** ahead of the shoulder season.

---

4. Conversion tracking — refined finding (important correction)

The prior pass flagged tracking as "polluted, bidding chases cheap junk." The live data **refines that**: the config *is* a mess, but the **bidding-counted signal is actually call-dominated and mostly real.**

Config reality: 29 enabled conversion actions — **23 marked Primary, 6 Secondary.**

What actually counts into `conversions` (the bidding signal), last 30d:

Action	Counted conv	Real lead?
ServiceTitan Inbound Call – Website	36.0	✅ real call
ServiceTitan Inbound Call – Extension	34.0	✅ real call
Calls from ads (PMax + Branded)	14.0	⚠️ likely duplicates the ext calls
ServiceTitan Calls Conversion Action	3.0	⚠️ duplicate pipe
ServiceTitan JVP (Call Extension)	3.0	⚠️ duplicate pipe
ServiceTitan JVP (Website)	2.0	⚠️ duplicate pipe
book_now_link_click	2.0	🟡 micro-action
Total	**~94**	

Two things this tells us:

1. **The good news:** ~74% of counted conversions are ServiceTitan inbound calls (Website 36 + Extension 34). The junk web micro-events — `phone_link_click` (53.7 in *all-conversions*), Local actions (Directions/Menu/Website visits), `button_click_buy_air_filter` — are landing in **all_conversions, NOT in the counted `conversions`**. So Smart Bidding today is largely optimizing to **actual phone leads.** The earlier "chases junk" framing was too harsh.
1. **The real problem is double-counting, not junk.** The same phone call is very likely counted **2–3×** through parallel pipes: `Calls from ads` (14) + `ServiceTitan Inbound Call – Extension` (34) + `ServiceTitan JVP (Call Extension)` (3) plausibly all fire on the same call-extension calls. Website side: `ServiceTitan Inbound Call – Website` (36) + `ServiceTitan JVP (Website)` (2). **This inflates the 94 and understates true CPA.**

Config hygiene risk (still worth fixing):

- **Inverted labeling:** the two best, cleanest signals — *ServiceTitan Inbound Call – Website / – Extension* — are marked **Secondary**, while Google Business "Local actions" (map taps, direction clicks) and GA4 micro-clicks sit as **Primary**. It works today only by luck of which actions fire; it's fragile.
- **Three overlapping systems** un-deduped: native GA4/GTM web events + **GoHighLevel** (`ghl_*`) + **ServiceTitan**.
- Every action is **MANY_PER_CLICK** → repeat callers inflate further.

Recommendation: pick **one** source of truth per lead type — **ServiceTitan connected call** for calls, **ServiceTitan booked job / genuine form** for web — mark *those* Primary, demote everything else (Local actions, GA4 micro-clicks, duplicate call pipes) to Secondary, and switch lead actions to **ONE_PER_CLICK**. This is a UI change (not in the script toolkit). Do it **before** scaling budget so we re-baseline a clean, de-duplicated CPA.

5. PMax — the single-asset-group ceiling

- **One asset group ("Services")**, status ENABLED, **Ad Strength EXCELLENT** (52 headlines, 15 long headlines, 14 descriptions, 45 YouTube videos, 31 images, logos, business name). Creative is not the constraint.
- **Impression share is rank-limited, not budget-limited:** loses **36.3% to Ad Rank** vs **17.7% to budget** (IS 46.0%). More budget alone won't fix rank loss.
- **PMax is buying heavy competitor-brand and generic queries** (new finding). Top search categories: `ambient edge` (5 conv), `air control home services` (4), `ac pro lake havasu` (5), `comfort air solutions`, `tri state air conditioning`, `the weatherman lake havasu`, plus equipment-brand terms (`carrier dealer`, `trane heat pump`, `bryant ac installers`). Good conquesting — but a black box with almost no query-level control or negatives.

Recommendation: split "Services" into service-line asset groups — **AC Repair / AC Install & Replace / Heating & Furnace / Maintenance** — each with tailored copy, **search themes**, and **audience signals** (upload ServiceTitan customer list + in-market HVAC). This lets us bid up high-value install queries and recover rank-lost impressions more cheaply than raising budget.

---

6. Non-branded Search is entirely OFF

Every non-branded Search campaign is paused. **PMax is the only non-brand engine** — meaning no query-level control, no negative-keyword hygiene, no diversification. This is the single biggest structural gap.

Recommendation: launch a **controlled Non-Branded Search campaign (built PAUSED for review)** on bottom-funnel intent — `ac repair near me`, `emergency ac repair`, `ac not cooling`, `hvac repair <city>` — at ~$30–50/day on tCPA against the cleaned goal. Gives us search-term control, negatives, and a second engine that isn't a black box.

---

7. Branded Search — small, mostly fine, one leak

Genuinely branded-only (all `mission accomplished *` keywords), 98.3% IS, tiny volume. One leak: the **EXACT** `mission accomplished heating and cooling` spent **$343 with 0 conversions**, while **EXACT** `mission accomplished` drove all 6 conversions for ~$56 total (QS 8). Low priority, but that one keyword is burning budget with no return — worth a look.

---

8. Geography

Confirmed live cities (PMax): **Lake Havasu City** (volume driver) and **Fort Mohave** carry most conversions; **Needles CA** is efficient; **Mohave Valley** and **Parker** show spend with thin conversion. Directional — a clean city-level CPA read requires the de-duplicated conversion signal from §4 first.

---

9. Budget discrepancy — verify in UI

Both live campaigns show a **$70/day** budget, yet June PMax spend (~$5,110 / 30) implies **~$170/day**. Either a shared budget, a recent trim, or a reporting quirk. **Confirm directly in the UI before any budget move** — don't act on the $70 figure.

---

10. Prioritized action plan

#	Action	Owner	Type	Why first
1	**Fix conversion config** — one source of truth per lead type, dedup call pipes, demote Local actions/micro-clicks, set lead	Edu (UI)	Foundational	Everything downstream depends on a clean, de-

#	Action	Owner	Type	Why first
	actions ONE_PER_CLICK			duplicated CPA
2	**Re-baseline true CPA** after cleanup	Edu	Measurement	Current $57 is inflated by double-counted calls
3	**Restructure PMax** into 4 service-line asset groups + audience signals	Edu (build)	Growth	Recovers 36% rank-lost IS cheaper than budget
4	**Launch Non-Branded Search (PAUSED)** on BOF intent, ~$30–50/day	Edu (build)	Growth + control	Only non-brand engine today is the PMax black box
5	**Verify $70 vs ~$170/day** budget in UI	Edu	Hygiene	Don't move budget on a wrong number
6	**Fix branded leak** — the $343/0-conv exact keyword	Edu	Hygiene	Pure waste
7	**Archive ~70 dead Levergy/stale campaigns**	Edu (script)	Hygiene	Readability; no perf impact
8	**Seasonality plan** — shift to heating/furnace messaging Sept+, don't panic-cut on CPA rise	Edu	Strategic	Summer CPA will not hold

Sequence: #1 → #2 gate everything. Do not scale budget (#3/#4 spend) until the conversion signal is clean and re-baselined.

---

11. Open questions for the client / AM

1. Confirm **ServiceTitan connected call** as the single call source of truth (vs GHL vs native).
2. Confirm the **$70/day** budget figure and whether it's shared.
3. Approve archiving the paused Levergy legacy campaigns.
4. Written budget approval before any scale (per TSD paid rule — never execute first).

Reversibility: no account changes were made in this analysis. All recommendations are proposals pending approval.
